

CALL MANAGEMENT

CashWebCommunity: a Software product of the Transtrack International Company.

Customer Service at its best

Workflow driven Incident, Complaint and Query management linked to SLA monitoring makes the difference towards the Client experience and for the Service staff involved. Across multiple departments and companies a call is tracked and monitored, web enabled for optimal supply chain integration.

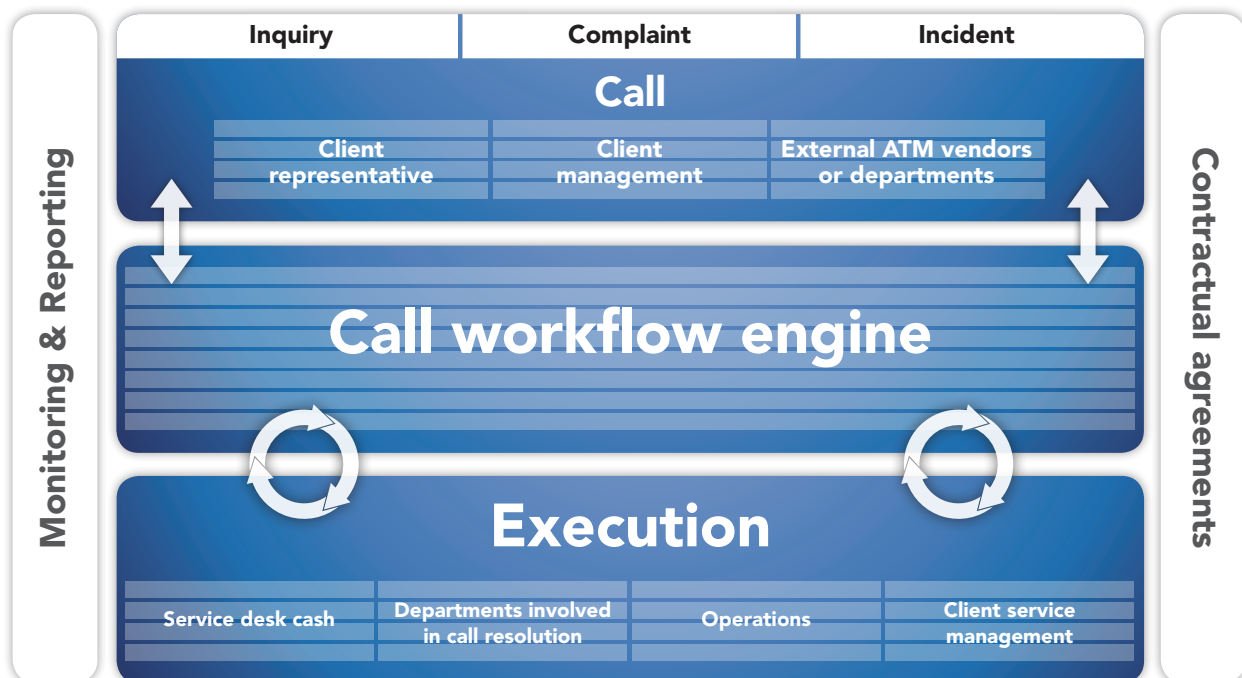

The registration and follow-up of calls is crucial to minimize the down-time of a cash machine, effectively handle complaints or queries from clients and provide the Customer Service department with an all embracing tool to investigate a call. Information regarding the cause of the call and the circumstances is available in the sys-

tem online. A call may be concerning a cash machine, an order, a service provided, a bag missing, a discrepancy or just a query from a client. It can be logged online by the client representative(s) or a call center. All departments and companies involved in the call resolution have online access to their task list and SLA monitor.

Automated escalation to management takes place based upon progress related to the SLA agreed with the client and operating procedure rules defined within the workflow engine.

Incidents, Queries and Complaints

The CashWebCommunity product

Workflow engine. A call (incident, query or complaint) can be logged online by the client representative(s). All departments and companies involved in the call resolution have online access to their task list and call monitor. Graphs and reports can be accessed based upon the authorization given to them. Contractual agreements (SLA) are used for monitoring progress and for automated escalations.

 **CASHWEBCOMMUNITY**
by Transtrack International

provides for a generic configurable workflow driven Call Management module which is able to deal with both automated incidents (from error messages received from a cash machine) and manually logged calls by the Customer Service department or the client representative using online access. Calls can be linked to certain entities in the system to enable faster analysis of the cause. External companies (like ATM service providers) can be authorized to login and process their tasks online. The management function is supported by online visibility of call resolution progress and statistics on calls and asso-

ciated resolutions. Clients can access graphical and report summaries online based upon their authorization rights.

Online Management Information

The module provides for online tracking and reporting on the progress and quality of the call management process and the SLA target and score against the target. Several levels of Management Information are provided to both Client and Service provider management.

Call category: ATM Printer Problem

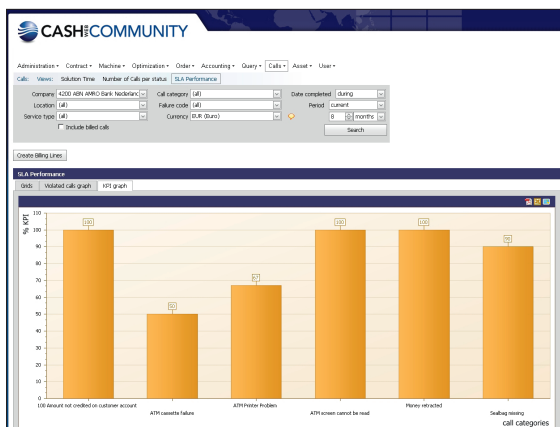

Name: ATM Printer Problem
Description: ATM Printer Problem
Type: Incident

Save Save and Close Back

Workflow

#	Type	Department	Description				
1	Check	Support Desk	Check ATM status				
2	Check	Support Desk	Create service order				
3	Check	Support Desk	Check if service order has been processed				
4	Check	Support Desk	Close incident
